(A) Recovery vs. boundary conductance
E_Ω (deviation from $V^*|_\Omega$)
boundary conductance $G_{\partial\Omega}$ (per edge)
$|\Omega| = 1$
$|\Omega| = 3$
$|\Omega| = 7$
(B) Hessian spectrum, alternative branch, $|\Omega| = 7$
$f'(V_{\text{alt}}) + \alpha + \lambda_k(L_{G_{\text{int}}})$
mode index k
(C) Adaptive isolation: internal vs. boundary
conductance
time
$V_- \to V_+ : \bar{G}_{\text{int}}$
$V_- \to V_+ : \bar{G}_{\partial\Omega}$
$V_+ \to V_- : \bar{G}_{\text{int}}$
$V_+ \to V_- : \bar{G}_{\partial\Omega}$
(D) Memory re-consolidation
$\overline{\varphi(m_i)}$ over Ω
time
$V_- \to V_+$
$V_+ \to V_-$
